

RUCHIKA KAUR, P.E., S.E., LEED AP

Vice President

Summary

Ruchika Kaur has been with Thornton Tomasetti for fourteen years. She started her career with an emphasis on the design of new buildings in education and the hospital and government sectors. Ruchika focused on Thornton Tomasetti's forensic engineering practice after spending over two years in Christchurch, New Zealand where she assessed and investigated hundreds of earthquake damaged buildings. Her experience includes damage and seismic assessment of existing facilities, remedial design for failed structures, the evaluation of construction defects, and building envelope assessments. She has also performed seismic assessments in Chile and Mexico. She has worked with both plaintiffs and defense teams, and has extensive experience in the Insurance Industry. Ruchika is a member of the forensics leadership team in the San Francisco office and works on expanding the Pacific-Rim market.

Areas of technical expertise

- Forensic Structural Engineering
- Repair and Retrofit Design
- Seismic Evaluation
- Structural Engineering Design

Education

- M.S., Structural Engineering Mechanics and Materials, 2007, University of California
- B.S., Civil Engineering, 2006, University of California

Registrations

- Licensed Professional Engineer in CA and WA
- Licensed Structural Engineer in CA
- LEED Accredited Professional
- Registered California Emergency Management Agency Safety Assessment Program Evaluator (SAPV65540)
- Safety Assessment Program (SAP) Evaluator, Post Earthquake Evaluations of Buildings, California Governor's Offices of Emergency Services (CAL OES)

Select project experience

Forensic structural engineering

Lincoln University, Christchurch, NZL. Damage evaluation, floor damage probability maps, repairs, repair quantities, and determination of additional work required for code compliance for 70 buildings on campus. Buildings varied from one-story light framed buildings to eight-story concrete building.

Ebb Tide, Newport Beach, CA. Water intrusion evaluation of 81 detached single-family units in construction. The investigation included on site observation and documentation of extent of damage, selective testing, localized demolition and repairs, and conclusions pertaining to causes of water intrusion.

Hurricane Michael, Arbor Properties, Multiple Locations, FL. Investigation of 70+ multi-family wood-frame residential buildings to assess damage caused by Category 5 hurricane.

Medistar Corporation, Houston, TX. Identify and document damage to the roof assembly, exterior envelope and interior of the building sustained by nine commercial and residential properties after Hurricane Harvey.

Confidential Retail Store Roof Collapse, Weiser, ID. Structural damage assessment, for an insurance adjuster, of a partial collapse of a retail store roof due to extensive snow storms. Project scope included emergency stabilization, evaluation of gravity and lateral elements, conceptual repair plans and the applicability of code-upgrades.

GPA Cabras 3 & 4 Powerplant, Hagatna, GUM. Structural damage assessment of a powerplant building housing two 40-megawatt engine generators following an explosion and fire. Project scope included a peer review of temporary roof design, evaluation of damage and repair methodology for the structural steel framing and cladding precast panels.

RUCHIKA KAUR, P.E., S.E., LEEDA P

Self-Realization Healing Centre, confidential location, NZL. Earthquake damage, defective workmanship and repair evaluation for a single-family residence used as a healing center. The building is constructed of a mixture of masonry and wood.

Colusa Casino, Colusa, CA. Investigated construction defects associated with wood and metal stud framing, and wood trusses using trussplate connectors.

Repair and retrofit design

Casa de Esperanza, Yuba City, CA. Determination of code related provisions applicable to reconstruction of the building after a fire, and preparation of construction drawings for fire restoration of the building. The original building is a wooden structure built in the early 1900s.

SURA Post-EQ Building Evaluation, Sonora, MX. Earthquake damage assessment and retrofit design for twelve properties in Mexico City following the September 2017 Puebla Earthquake.

Bradley Nuttall House, Christchurch, NZL. Damage assessment, repair plans, analysis to determine the building capacity and prepare strengthening plans for earthquake prone elements, allocation of earthquake-related repairs. The property is a seven-story concrete commercial building with approximately 575-square-meter-area per floor.

Seismic evaluation

Nob Hill Condominium, San Francisco, CA. Evaluate the building for seismic vulnerabilities and prepare conceptual seismic retrofit plans. The condominium is a 19-story reinforced concrete building with three underground levels.

U.S. Department of Energy, Sandia National Laboratories, Buildings 904, 914, 940 and 910 Lobby, Tier 2 Evaluation, Livermore, CA. Seismic evaluation of buildings to life safety performance criteria for deficiencies identified in a previous Tier 1 evaluation. Summarized findings in a report and assessed the buildings' seismic risk level. Developed conceptual seismic retrofit sketches based on evaluations to mitigate deficiencies such that the structural systems will meet LSP criteria.

Structural engineering design

Humboldt State University, College Creek Student Housing, Arcata, CA. Structural design of eight three-story residential buildings grouped into four complexes with covered walkways and elevator/stair cores and a two-story community center.

Contra Costa Community College District, Contra Costa College Center Complex, San Pablo, CA. Structural design of a new classroom building and student activities complex. The classroom building is a 52,000-square-foot, three-story structure housing computer labs, classrooms, and a tiered lecture hall. The student activities complex consists of the 47,000-square-foot, two-story main student activities building and the 3,200-squarefoot Fireside Building.

NorthBay Healthcare, Green Valley Medical Office Building, Fairfield, CA. Structural engineering for a developer-led, 35,000-square-foot, two-story precast concrete medical office building. The project required close collaboration with the design team, contractor, developer and owner to optimize design and constructability efficiencies and identify the most cost-effective design solutions.
